

- differential equation : y 에 unknown f' 가 있음.

implicit form $F(x, y, y') = 0$

explicit $y' = f(x, y)$

- ODE ordinary differential equation $\frac{dy}{dx}$ 미분

$\downarrow$

PDE Partial (편미분) 여러 변수에 대한 편미분

- 종류

IVP (initial value problem) 초기점 1개에 대한 값(들)만 주어진

BVP (Boundary ..) 두개 이상의 지점에서의 값을 주어진

- direction (slope, vector) field

ODE $y' = f(x, y)$ 극점마다 y' 를 계산해서 표시

- ODE IVP 풀기

1차 $\rightarrow$ 상미분방정식 $\frac{dy}{dx} = f(x)$ / 2차 $\rightarrow$ 편미분방정식, 그곳의 미분방정식

- 수치해법으로 IVP : 구간 $[a, b]$ 에서 나눌 구간 N 개로.

$$\text{step size } h = \frac{b-a}{N}$$

① Euler

$$\underbrace{y(x_i + h) = y(x_i) + h y'(x_i) + \frac{h^2}{2!} y''(x_i) \dots}$$

↓

$$y_{x_{i+1}} = y_{x_i} + h f(x_i, y_i)$$

- local error $O(h^2) \longrightarrow$ global $O(h)$

② Runge-Kutta (2차 RK2)

$$y_{i+1} = y_i + \frac{h}{2} (k_1 + k_2) \quad \left(\begin{array}{l} k_1 = f(x_i, y_i) \\ k_2 = f(x_i + h, y_i + h k_1) \end{array} \right)$$

local error $O(h^3) \longrightarrow$ global $O(h^2)$

$$\text{RK4} : y_{i+1} = y_i + \frac{h}{6} (k_1 + 2k_2 + 2k_3 + k_4)$$

local error $O(h^5)$

↓

global $O(h^4)$

$$\left(\begin{array}{l} k_1 = f(x_i, y_i) \\ k_2 = f(x_i + \frac{h}{2}, y_i + \frac{h}{2} k_1) \\ k_3 = f(x_i + \frac{h}{2}, y_i + \frac{h}{2} k_2) \\ k_4 = f(x_i + h, y_i + h k_3) \end{array} \right)$$

- Ex 17.1 $y' = 2x - y$, $y(0) = -1$, $x \in [1]$ with $N = 10$

$$h = \frac{1-0}{10} = 0.1$$

$$k_1 = 2 \cdot 0 + 1 = 1$$

$$k_2 = f(x_i + h, y_i + h k_1)$$

$$= f(0.1, -1 + 0.1 \cdot 1) = f(0.1, -0.9)$$

$$= 2(0.1) + 0.9 = 0.2 + 0.9$$

$$= 1.1$$

$$y_1 = y_0 + \frac{h}{2} (k_1 + k_2)$$

$$= -1 + \frac{0.1}{2} (1 + 1.1)$$

$$= -1 + \frac{2.1}{20} = -1 + \frac{21}{200} = \frac{-1000 + 105}{1000} = -\frac{895}{1000} //$$
